TDA9821

Dual channel TV FM intercarrier sound demodulator

Philips
Semiconductors

PHILIPS

Dual channel TV FM intercarrier sound demodulator

TDA9821

FEATURES

- Two alignment-free PLL FM demodulators
- Automatic second sound carrier mute
- Mono and dual channel application
- Low power consumption
- Few external components required.

GENERAL DESCRIPTION

The TDA9821 is a monolithic, integrated, TV FM intercarrier sound demodulator for all FM standards. The circuit contains two separate FM demodulators using Phase Locked Loop (PLL) reference frequency generation. The circuit requires a minimum number of external components.

QUICK REFERENCE DATA

Fig.2 Pin configuration.
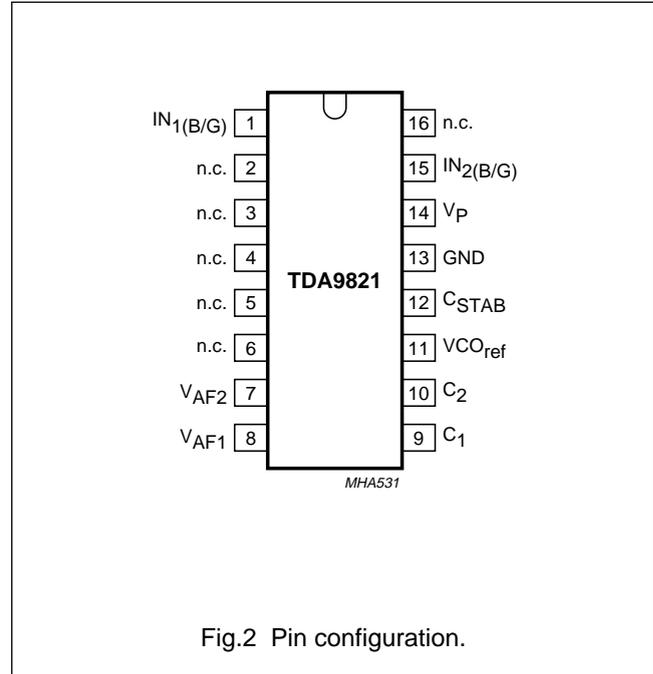

FUNCTIONAL DESCRIPTION

The complete circuit consists of two separate channels, each consisting of a limiter-amplifier, FM demodulator and AF amplifier. Circuit operation is also described in Fig.1.

FM demodulators

The intercarrier signal is fed through external ceramic band-pass filters which are tuned to the sound carrier frequencies.

Each limiter-amplifier is AC-coupled into a FM demodulator. The integrated FM demodulator PLLs are alignment-free. The FM demodulator outputs are amplified to 500 mV (RMS value). High amplification and DC error signals of the PLLs, which are superimposed on the FM demodulator outputs, require DC decoupling at pins 9 and 10 of the AF amplifier inputs.

Stereo channel separation adjustment (optional)

Optimal stereo channel separation is achieved by adjusting V_{AF1} (pin 8) and V_{AF2} (pin 7) as follows:

1. V_{AF1} by a resistor in series with the DC decoupling capacitor at pin 9

2. V_{AF2} by a variable resistor in series with the DC decoupling capacitor on pin 10 to the same voltage as V_{AF1}.

Normally stereo channel separation is adjusted in the stereo decoder for the B/G standard.

Dual channel TV FM intercarrier sound demodulator

TDA9821

Second sound carrier mute

The output of the second FM demodulator is muted when the signal level (signal and/or noise) at pin 15 is less than typically 0.5 mV (RMS value). This avoids an incorrect stereo or dual sound identification when a mono signal is

transmitted. Therefore, with a mono transmission, there is no audio output at pin 7. When the signal level at pin 15 is greater than typically 1.0 mV (RMS value) mute is switched off.

LIMITING VALUES

In accordance with the Absolute Maximum Rating System (IEC 134).

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_P	supply voltage (pin 14)		−0.5	+9.0	V
V_i	input signal (pins 1 and 15)		−0.5	+5.0	V
t_s	short-circuit time (each pin except pins 13 and 14 to be tested; one at the time)		−	10	s
T_{stg}	storage temperature				
	device		−25	+125	°C
	device in packing		−25	+85	°C
T_j	junction temperature		−	150	°C
T_{amb}	operating ambient temperature		0	70	°C
V_{es}	electrostatic handling for all pins	note 1	−500	+500	V
		note 2	−4000	+4000	V

Notes

1. Equivalent to discharging a 200 pF capacitor via a 0 Ω series resistor.

2. Equivalent to discharging a 100 pF capacitor via a 1.5 kΩ series resistor.

		V_P = 5.0 V	24	30	–	dB
		V_P = 5.5 V	21	27	–	dB

Dual channel TV FM intercarrier sound demodulator

TDA9821

Notes

1. The output signal at pin 7 can only be measured when mute is disabled. This is achieved by inserting a resistor of 2.7 kΩ between pin 15 and ground. In this event the input impedance is 490 Ω.

2. Improvement of ripple rejection is possible by connecting series RC between pin 11 and pin 14 (15 kΩ + 2.2 μF; see Fig.5) for a supply voltage of 4.5 to 5.5 V. The rejection of ripple frequencies up to 3 kHz is improved, but up to 200 kHz is worse; see Fig.3.
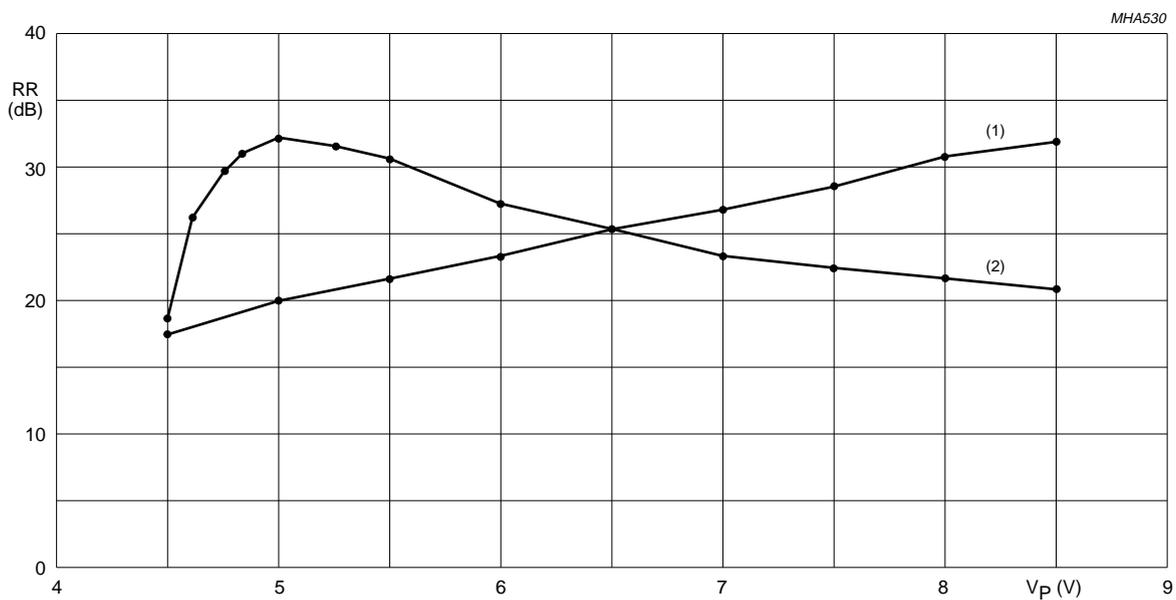

The curves are typical and valid for ripple frequencies between 50 Hz and 3 kHz.

Conditions: input signal: f = 5.5 MHz, 10 mV (RMS value); ripple on V_P = 100 mV (RMS value), f_r = 1 kHz; ripple rejection measurement: unweighted RMS.

(1) Without RC.

(2) With R = 15 kΩ and C = 2.2 μF.

SOLDERING

Introduction

There is no soldering method that is ideal for all IC packages. Wave soldering is often preferred when through-hole and surface mounted components are mixed on one printed-circuit board. However, wave soldering is not always suitable for surface mounted ICs, or for printed-circuits with high population densities. In these situations reflow soldering is often used.

This text gives a very brief insight to a complex technology. A more in-depth account of soldering ICs can be found in our *"IC Package Databook"* (order code 9398 652 90011).

Soldering by dipping or by wave

The maximum permissible temperature of the solder is 260 °C; solder at this temperature must not be in contact with the joint for more than 5 seconds. The total contact time of successive solder waves must not exceed 5 seconds.

The device may be mounted up to the seating plane, but the temperature of the plastic body must not exceed the specified maximum storage temperature ($T_{stg\ max}$). If the printed-circuit board has been pre-heated, forced cooling may be necessary immediately after soldering to keep the temperature within the permissible limit.

Repairing soldered joints

Apply a low voltage soldering iron (less than 24 V) to the lead(s) of the package, below the seating plane or not more than 2 mm above it. If the temperature of the soldering iron bit is less than 300 °C it may remain in contact for up to 10 seconds. If the bit temperature is between 300 and 400 °C, contact may be up to 5 seconds.

DEFINITIONS

Data sheet status	
Objective specification	This data sheet contains target or goal specifications for product development.
Preliminary specification	This data sheet contains preliminary data; supplementary data may be published later.
Product specification	This data sheet contains final product specifications.
Limiting values	
Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.	
Application information	
Where application information is given, it is advisory and does not form part of the specification.	

LIFE SUPPORT APPLICATIONS

These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips for any damages resulting from such improper use or sale.
